Number Reversal

– A trick you can perform completely naked.. if that's your sort of thing..”

What They See..

The mind reader asks for a volunteer who is 'good with numbers'.

The mind reader says to the volunteer..

“Think of a 3 digit number, make it hard, make them 3 different numbers and not anything easy like 123..”

The spectator says they've got one..

The mind reader says..

“Good, now reverse the 3 digit number to get another number, so if you had 123, you would reverse it and get 321 aswell”

“So you have two 3 digit numbers, say for example, 123 and 321. To make it completely random, I want you to take away the small 3 digit number from the big 3 digit number, for example, you would take away 123 from 321. Leaving you with a final number.. this is why I needed someone good with numbers, I recommend you use a piece of paper to do the working out on.. take your time, this isn't a test.. get the person next to you to work it out also to make sure it's correct..”

The spectator nods his head.

“Now remember this final number, this is the number I'm going to try and read off you.. I needed you to do this to become mathematically connected to the number, it makes it easier for me to read it off you as you've seen it form..”

“Look at me.. ok.. I keep seeing a 3 digit number.. is it 3 digits?”

The spectator says yes.

“Ok, look at me, this is really hard, bear with me.. I can see a two, is two the first number?”

The volunteer smiles.

“Look at me.. is it 297?”

The spectator says yes...

The crowd are in awe.

The Trick Revealed..

Introduction

This is a little bit of maths mixed with a bit of balls and luck..

If you reverse a three digit number (with 3 different numbers) and take away the smallest 3 digit number you are left with a limited amount of numbers it could be.

The Method

You need to first find out whether it's a 3 digit or 2 digit number they are left with. To make more sense for you, here are the ONLY numbers they could be left with.

	99	
1<u>9</u>8		8<u>9</u>1
2<u>9</u>7		7<u>9</u>2
3<u>9</u>6		6<u>9</u>3
4<u>9</u>5		5<u>9</u>4

These numbers are easy to remember as there has to be a nine in the middle (if it's a 3 digit number) and then you add up with 2 outside numbers to make nine. Look at the first number **198**, $8+1 = 9$.

So basically, you need to find out if it's a 3 digit number, **if it isn't, you know it's 99.**

If it's a 3 digit number you need to find out the last number. U can do it knowing the first, but it covers you more if you find out the last number first.

So you say, ok.. I can see a 2.. is there a 2? If there is, you know it's either 297 or 792, so as I got it right first time I will usually ask if it's the first number.

If there isn't a 2, say,

“Oh right, well what's the last number then? I can't see it clearly, I got a 2..”

If they say it's a 6, you know its 396.

So say, “ohhh, I had 392, but it's 396 right?”

You see how it works? You need to just fish around until you hit. It usually goes smoothly, but worst case scenario, get the last number by using the above example.

Have fun with this!
